

Confinement Fencing

Weldy Confinement Fencing offers great versatility through a choice in height, length, and vertical spacing. This choice allows for virtually any size and shape pens to fit your facilities. Weldy Confinement Fencing is normally painted with two coats of high quality paint adding years to its useful life. Galvanizing is available at your request.

Post mounting plates are available to permanently attach divider panels to floor.

Weldy Confinement Fencing does not have separate posts. Brackets for gate panels are welded directly to divider panels.

Wall brackets allow panels to be attached to walls or building posts.

The 1/2" pin is protected by a 3/4" tube as well as the 1 1/4" x 3/16" hinge strip. This protects it from being disengaged by the livestock.

This pin at the bottom of each gate panel is a part of each panel and is inserted into lower hinge strap. This allows for gates to hinge in or out and at either end.
